Phloretin, phenolic compound found exclusively in Apple trees, possesses bioherbicidal potential towards other plant species. Our recent studies emphasized phloretin phytotoxic action towards model plant *Arabidopsis* [*Arabidopsis thaliana* (L.) Heynh.] as a consequence of disturbed auxin homeostasis in roots and disrupted normal leaf cell function due to chloroplast ultrastructural changes and decreased chlorophyll a and b levels. Given the known phloretin reactivity that results from its flexible dihydrochalcones structure, this study aimed to elucidate phloretin direct effects on the root plasma membrane, as well as phloretin post-treatment metabolism in *Arabidopsis* plants. Electrophysiological measurements were performed to assess real-time response of root plasma membrane to exogenously applied phloretin. Exposing *Arabidopsis* roots to a 250 μ M phloretin resulted in rapid and significant depolarization of the root membrane potential with amplitude of about 47mV that confirmed high sensitivity of *Arabidopsis* to phloretin treatment. Reverse-phase liquid chromatography with mass spectrometry (LC-MS) was used to evaluate post-treatment metabolism of phloretin in *Arabidopsis* seedlings grown on 500 μ M phloretin enriched medium for 10 days. Analyses revealed that phloretin underwent intensive glycosylation within plant tissues. Dominant peaks from treated plants showed a palette of phloretin derivatives mainly mono- and di-glycosides. Their quantity was significantly higher than in control plants, suggesting high uptake and metabolic interconversion of phloretin as an attempt of phloretin detoxification and/or preparation for vacuolar sequestration.

Keywords: electrophysiological measurements, liquid chromatography with mass spectrometry, membrane potential, phloretin, phytotoxicity
