The use of bioherbicides offers the possibility to suppress harmful weeds by ecologically acceptable methods and thus increase crop productivity. Progress in understanding the mechanisms of bioherbicides action and weed defense response mechanisms, could help in defining novel weed control strategies. This work highlights the bioherbicide potential of rhizomes of Sorghum halepense L., characterized by a high content of phenolic acids, especially p-hydroxybenzoic acid (pHB A) and chlorogenic acid (CHL A). Methanol extract of S. halepense rhizome (SHR), and its major bioactive principles, displayed phytotoxic effects against Chenopodium murale L., which is a common weed of fields and roadsides. Besides reduction in C. murale seed germination, rhizome extract of S. halepense applied in the concentrations of 0.01, 0.1, 1 and 2 mg/ml, induced changes in the activity of antioxidant enzymes in seedlings. Catalase (CAT) activity was increased, while peroxidase (POX) and superoxide dismutase (SOD) activities were generally decreased, with a few exceptions (increased POX and SOD activities at 0.1 mg/ml at 0.01 mg/ml SHR, respectively), suggesting that CAT is the major responsible for the elimination of reactive oxygen species generated during the exposure of C. murale seedlings to SHR. Application of CHL A induced changes in the activities of antioxidant enzymes, similar to those observed on SHR treatments. The treatment with pHB A did not significantly change the activity of POX and SOD, while CAT activity was significantly increased at all applied concentrations. These data highlight the phytotoxic potential as a highly efficient strategy of S. halepense to invade new habitats.

Keywords: Sorghum halepense, Chenopodium murale, rhizome extract, phenolic acid, antioxidative enzimes
