The genus *Nepeta* L. comprises medicinal plant species that synthesize terpenes and phenolics of therapeutic value. Considerable variability in qualitative and quantitative content of iridoid monoterpenoids has been detected within the genus *Nepeta*, which comprises iridoid producing and non-producing species. *Nepeta rtanjensis* Diklić & Milojević is an endemic plant of the Balkan Peninsula, which produces both iridoid aglycones (IAs) and iridoid glucosides (IGs). *N. nervosa* Royle ex Benth., endemic to the Himalayas of Kashmir, India, and Pakistan, is iridoid-lacking species. This study aimed to comparatively analyze the effect of methyl jasmonate (MeJA), an elicitor of terpene production in many plant species, on iridoid biosynthesis at the molecular level. Iridoid content in MeJA-treated *N. rtanjensis* and *N. nervosa* plants under *in vitro* conditions was analysed in parallel with the co-expression patterns of iridoid related biosynthetic genes (*GPPS*, *GES*, *G80*, *8HGO*, *7DLGT*, *IS*, and *NEPS*), major latex protein-like gene (*MLPL*), and genes coding for different transcription factors (*MYC2*, *YABBY5*, *COI1*, and *JAZ3*). In general, the exogenous application of 250 µM MeJA for 2 h, 24 h and 72 h resulted in an increased accumulation of targeted IAs (trans, cis-nepetalactone and 5,9-dehydronepetalactone) and IGs (1,5,9-epideoxyloganic acid) in leaves of *N. rtanjensis*, as a result of elevated expression of the key biosynthetic genes. Interestingly, although the majority of iridoid-related biosynthetic genes and TFs were identified in transcriptome of *N. nervosa* leaves, and the expression of some of them (*NEPS* and *JAZ3*) is up-regulated following MeJA treatment, no iridoids were accumulated in leaves of *N. nervosa*.

Keywords: *Nepeta rtanjensis*, *Nepeta nervosa*, chemotypes, methyl jasmonate, iridoid biosynthesis
